## Introduction

The quality of wine can be mystifying despite being of central importance to the practice of making it, but it may be no enigma whatsoever for vintners and sommeliers, whose professions require diverse experience with and deep understanding of wine; and the well-to-do, whose means allow them to have similarly diverse experiences with the potation and the social impetus to seek wines of the highest perceived quality.

In this study, we aim to leverage the statistical sciences to uncover just *how* a wine, on account of its constituent substances and their combination, achieves a particular level of quality.
